Mitchell Power Station is located in Courtney, Pennsylvania, along the Monongahela River.

Facts At A Glance

- One coal-fired unit and one oil-fired unit produce a combined total of 370 megawatts (MW) of electricity.
- Unit 1 went online in 1948, but was decommissioned in 2003. Oil-fired unit 2 went online in 1949 and generates 82 MW. Coal-fired unit 3 went online in 1963 and generates 288 MW.
- At full capacity, the plant’s generating units can produce nearly 9 million kilowatt-hours of electricity daily.
- The plant uses more than 430,000 tons of coal annually.
- Mitchell Power Station employs approximately 75 people.
- The plant pays more than $150,000 annually in property taxes.

Environmental Measures

The plant has invested nearly $130 million on its environmental-control systems.

The station is equipped with Electrostatic Precipitators. This system removes more than 95 percent of the fly ash from flue gases.
