## PSC SERIES PROSPREAD COMMERCIAL SPREADERS

PSC series truck and trailer apron box spreaders are the ideal choice for industrial operators who need a high-capacity, heavy-duty machine capable of spreading the most demanding materials. Available with a choice of horizontal beaters, vertical beaters, or the new spinner discharge, the PSC series spreader is highly customizable to work for you to get the job done. For spreading anything from compost, to **biosolids** to many other industrial materials, these machines will provide top-quality performance and years of dependable service. When the task at hand is transporting material, the beater assembly is easily removed and the PSC becomes an ideal tool for hauling material to a storage site. Optional scale systems and GPS data mapping software are also available, making the PSC a highly-efficient, finely-calibrated machine.

### Horizontal Beaters

Horizontal beaters are best used in spreading applications where solid, coarse materials are being spread. They work well in situations where fast unloading and high application rates are desired. These beaters create a spread pattern approximately as wide as the spreader.

### VertiSpread Beaters

VertiSpread vertical beaters provide quality spreading performance for a wider variety of materials ranging from biosolids to finer materials like compost. They can provide the same fast unloading and high application rates as horizontal beaters, but with a wider spread pattern and more consistent material breakup.

### AccuSpread Spinner Discharge

The AccuSpread spinner discharge offers consistent spreading of dry, flowable materials such as dry compost, poultry litter and separated solids. Material is broken up by two horizontal beaters and then drops onto the rotating spinners for discharge. It provides the widest, most uniform spread pattern available.
